

Problem set is due Thursday, Feb. 7th in class.

1. Using the German Weimar Republic Data, estimate a sensible regression (using R) with two independent variables. (For help with a “sensible” regression, consult the articles that are listed using the data set on the ICPSR web site. Another resource is Thomas Childers’s book “The Nazi Voter.”)
 - (a) Check the regression for influential observations and reestimate if necessary.
 - (b) Substantively interpret all estimated coefficients, standard errors, and the residual standard error.
 - (c) Demonstrate how every number (25 of them) in the regression summary is calculated.
